Reference Document

This is the pristine, undamaged original. Every corrupted file in the pack is a descendant of this document, so a working repair tool should recover the same 5 pages, the same text, the same table, the same chart and the same image you see here.

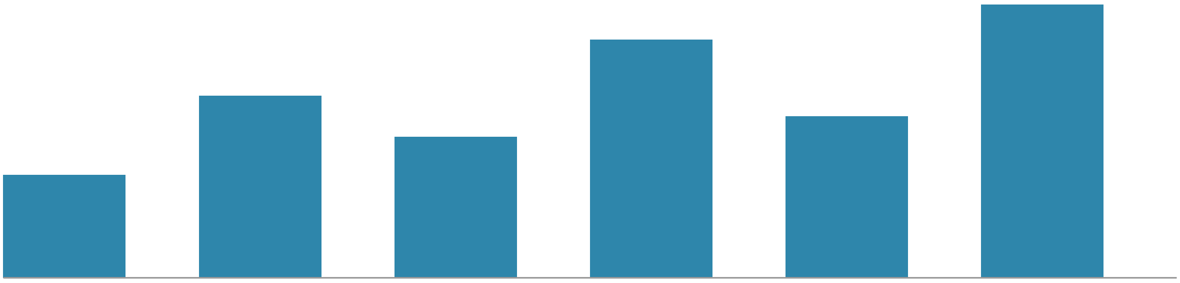

Figure 1: raster image (JPEG XObject) - if this is missing, image recovery failed.

Page 3 - Table

Corruption class	Severity	Expected outcome
Truncated file	High	Rebuild from survivors
Bad xref offsets	Medium	Rebuild xref by scanning
Broken page tree	High	Reconstruct /Kids
Damaged xref stream	High	Scan for objects
Header + junk	Very high	Best effort

Page 4 - Bullets

- Metadata survives repair (title, author).
- All five pages must be present.
- Fonts must remain embedded or substituted cleanly.
- The chart on page 1 must still render.
- The image on page 1 must still render.
- The form field on page 2 must survive.
- No blank pages should be introduced.

Page 5 - Checksum text

If your tool recovers this page, it recovered the last object in the file. That is the hardest part of a truncated or xref-damaged document, because the trailer and the final page object are usually the first casualties. Marker string: ZEBRA-9-DELTA-OK.
